Soil texture affects soil fertility and nutrient management: Most sulfur deficiencies occur in sandy soils. Nitrogen is easily leached from sandy soils. Loss of soil nitrogen (denitrification) is more common on heavy, clay soils. Potassium can leach from sandy soils but is immobile in medium- to fine-textured soils.

Grapevine Nutrition Grapevines have fewer mineral deficiency problems and fertilizer demands than many other horticultural crops and are adaptable to a wide range of soil types and soil fertility. In general, only four nutrients, nitrogen (N), potassium (K), zinc (Zn), and boron (B) are widely supplemented in vineyards.

Soil Fertility and Vine Nutrition

Organic matter contains nutrients that are released for plant uptake through microbial decomposition. As soil minerals (clays, carbonates, etc.) weather (breakdown) they release nutrients for plant uptake. A good example of this is potassium. As plant residues breakdown, the nutrients in them become available to growing plants.
