Read Free Dna Replication Paperclip Activity Questions ...

DNA replication occurs with the involvement of many enzymes. The DNA molecule is unzipped and therefore separated into two single strands that we will call the "parent strands". These are then used as templates for the complementary base pairing that will take place.

Paperclip Activity. Replication Overview: •

- To “replicate” DNA means to produce an exact copy of itself. • DNA is able to make an exact replica of itself because of the base pairing characteristics (A with T and C with G). • When DNA makes a duplicate molecule of itself, the two strands unwind.

Paperclip Activity Answers

DNA replication begins at specific sites called origins of replication. A eukaryotic chromosome may have hundreds or even a few thousand replication origins. Proteins that start DNA replication attach to the DNA and separate the two strands, creating a replication bubble. At each end of the replication bubble is a Y-shaped region where the parental strands of
