Repeat the seesaw problem in Example 9.1 with the center of mass of the seesaw 0.160 m to the left of the pivot (on the side of the lighter child) and assuming a mass of 12.0 kg for the seesaw. The other data given in the example remain unchanged. Explicitly show how you follow the steps in the Problem-Solving Strategy for static equilibrium.

There is a relationship between work and mechanical energy change. Whenever work is done upon an object by an external or nonconservative force, there will be a change in the total mechanical energy of the object. If only internal forces are doing work (no work done by external forces), there is no change in total mechanical energy; the total mechanical energy is said to be "conserved."

A useful means of visually representing the vector nature of an electric field is through the use of electric field lines of force. A pattern of several lines are drawn that extend between infinity and the source charge or from a source charge to a second nearby charge. The pattern of lines, sometimes referred to as electric field lines, point in the direction that a positive test charge would ...

It is unclear whether military shoes (combat boots and sports shoes) attenuate loading rate or affect force transfer during walking. Therefore, this study compared ground reaction forces (GRF) related to impact and force transfer between combat boots, military sports shoes, and running shoes. Ten army recruits walked over a walkway with two force plates embedded.

This paper provides conditions for the existence of a solution to the second-order nonlinear boundary value problem on the half-line of the form $\Delta a(n)\Delta x(n) = f(n+1, x(n+1), \Delta x(n+1)), n \in \mathbb{N} \cup \{0\}$, with $\alpha x(0) + \beta a(0)\Delta x(0) = 0, x(\infty) = d$, where $d, \alpha, \beta \in \mathbb{R}, \alpha^2 + \beta^2 > 0$. To achieve our goal, we use Schauder's fixed-point theorem and the perturbation technique for a Fredholm operator of index 0 ...
