The main five parameters measured in fluorescence spectroscopy are:excitation spectrum, emission spectrum, decay times, quantum yield and anisotropy (or polarization). The description of the fluorescence measurable parameters is best understood with the introduction of the Perrin-jablonski diagram, which is a quantum mechanics representation of the energy levels of a molecular structure.

Fluorescence Spectroscopy - ISS

Fluorescence spectroscopy is a type of electromagnetic spectroscopy that analyzes fluorescence from a sample. It involves using a beam of light, usually ultraviolet light, that excites the electrons in molecules of certain compounds and causes them to emit light; typically, but not necessarily, visible light. A complementary technique is absorption spectroscopy. In the special case of single molecule fluorescence spectroscopy, intensity fluctuations from the emitted light are measured from eithe

Fluorescence spectroscopy - Wikipedia

Fluorescence spectroscopy is a powerful method that can be applied to diverse biological problems. It relies on the intrinsic chromophores that many native protein sequences contain, for example, tryptophan side chains. Alternatively, nonnative chromophores can be site-specific introduced into both protein and DNA molecules.
