This article reviews the use of common diagnostic tools for the identification and isolation of dermatophyte infections in small animals. The use of the Wood's lamp as a screening tool is discussed, along with its usefulness as an aid in the microscopic examination of hairs for fungal elements. Tests for the definitive diagnosis of dermatophytosis are highlighted and include: direct examination of hair for ectothrix spores, fungal cultures, and skin biopsy.

### **Diagnostic techniques for dermatophytosis - ScienceDirect**

They are a group of keratinophilic fungi that can infect keratinized tissues of human and animals such as skin, hair and nails causing dermatophytoses. These infections are also a major grounds for morbidity-associated superficial mycoses, with recurrent relapses and often refractory to therap 3.
