Postharvest physiology is about the plant response to technologies and other applications that extend shelf life and quality and delay senescence (plant death). Quality itself includes aspects that are appealing to consumers, such as appearance, aroma, taste, color (sensory), reduced risk of foodborne pathogens or pesticide residues (food safety) or more dense nutrient or phytonutrient content.

In agriculture, postharvest handling is the stage of crop production immediately following harvest, including cooling, cleaning, sorting and packing. The instant a crop is removed from the ground, or separated from its parent plant, it begins to deteriorate. Postharvest treatment largely determines final quality, whether a crop is sold for fresh consumption, or used as an ingredient in a processed food product.
